

UNO ERP — Official Release Documentation

Release Tag: v2026.08.21-PROD-RELEASE | **Date:** August 21, 2026 | **Production URL:** <https://uno-dmc.cz/>

Executive Summary: Release **v2026.08.21-PROD-RELEASE** introduces enterprise governance upgrades, full role-based access control (RBAC), automated project status checkpoints, an interactive AI Assistant Copilot, and an MSBuild deployment pipeline fix for ASP.NET Core static SPA deployment.

1. Major Features & Architecture Upgrades

- **Interactive AI Copilot Drawer (AIChatDrawer.tsx):** Accessible from the bottom-right corner of all application screens for instant Q&A, guidance, and direct links.
- **Hybrid RAG Engine (AIChatController.cs):** Dynamically retrieves live AppDB tour/project metrics alongside AI Knowledge Base SOPs and Governance rules.
- **User Accounts & Role Permissions (RBAC):** Full user management with Administrator, TourAdmin, and Manager role permission matrices.
- **Automated Tour Status Checkpoints (Gatekeeping):** 4-stage project workflow validation (Proposal -> Confirmed -> In Progress -> Completed).
- **Multi-Category Hotel Pricing:** Supports Single, Double, Twin, Triple room rates and Pax rates.
- **Excel Import Engine:** Multi-sheet Excel import for Tour Rooming lists, Flight Manifests, and Excursion Sales Checkbox Grids.

2. Deployment Pipeline & MSBuild Fixes

- **MSBuild StaticWebAssets Fix (Uno_API.csproj):** Set `<StaticWebAssetsEnabled>>false</StaticWebAssetsEnabled>` to prevent MSBuild file hash caching crashes when Node rebuilds Next.js SPA.
- **Clean WebDeploy Setup (site84253-WebDeploy.pubxml):** Enabled `<SkipExtraFilesOnServer>>false</SkipExtraFilesOnServer>` and `<TakeAppOffline>true</TakeAppOffline>` to force clean IIS process recycling and remove legacy DLLs.
- **Database Auto-Migration (Program.cs):** Converted monolithic startup SQL script into an array of independent `ExecuteSqlRaw` statements wrapped in individual try/catch handlers.

3. How to Train & Seed the Production AI Chatbot

The Production AI Chatbot queries the `AiKnowledgeItems` database table live on every request. **No code re-compilation or server restarts are required to train the bot.**

- **Step 1 (SQL Seeding):** Execute the provided `seed_ai_knowledge_v2026_08_21.sql` script directly against `db63111.databaseasp.net` in SSMS.
- **Step 2 (Instant Availability):** The chatbot immediately retrieves the newly seeded SOPs, release details, and rule explanations.
- **Step 3 (Visual UI Management):** Navigate to **Master Data -> AI Knowledge Base** tab on <https://uno-dmc.cz/> to edit or add new Q&A; items visually at any time.
